

Customer dynamic pricing

Find items, compare customer pricing and location stock, and add multiple lines from a pop-up browser on Sales Orders and Estimates/Quotes.

Faster quote and order entry across large catalogues.

Customer Item Price Picker: catalogue filters, customer pricing and optional price saving.

Find the right items

Search and filter the catalogue, page through results and see only items eligible for the transaction under the standard product rules.

An optional filter shows only items that already have a specific price for the selected customer.

Compare price and availability

See the customer's applicable specific price alongside the base price, with current stock for the location selected on the transaction.

Results use the NetSuite data available to the executing user at the time of the query and respect role, subsidiary, item and location permissions.

BULK LINE ENTRY

Add multiple items in one action

Repeated selections increase the item quantity. Review selected items and quantities before adding the lines to the transaction. Standard validation messages identify any line that cannot be added.

Control prices. Review changes.

Save customer-specific prices

Where enabled, authorised users can enter and save a new customer-specific price while creating an order or quote. The saved price is used in future supported transactions, using the product's standard customer and item matching rules.

Price saving can be enabled or disabled for nominated roles. Users must deliberately select the save option; transaction entry alone does not overwrite a stored price. Your team controls user authorisation and validates the prices entered.

Choose useful query detail

Additional standard columns may be enabled from data already available to the query, subject to field availability, performance and role permissions.

Examples include item code, description, item group, preferred stock level, cost and estimated sales margin.

See gross profit when pricing is revised. Margin and cost information is shown only where the underlying NetSuite data and user permissions allow it.

Review the pricing audit trail

See when pricing changes were made, who made them and the records affected.

- Review changes by employee or customer within a selected date range.
- Filter by Added, Removed, Changed or Not Itemised.
- Compare previous and revised values, including the profit or cost difference where applicable.
- View the related Sales Order.
- Export filtered results to CSV for review or reporting.

One standard product design is maintained for all customers.
